Module 7 Contribution Journal

For my contribution for this week assignment, I volunteered to submit the work in Canvas on behalf of the group. I worked through the lab, inserted code as needed, completed the reflection questions at the end, and recorded my experience in my journal pages. Then I compiled all of my team members' documents, created a repository, and uploaded the assignment into GitHub. I made sure to maintain communication with the team when necessary.

Contribution Journal -Model Evaluation Lab

Diane Lenhoff

Individual Contribution

For this lab, I worked on evaluating the performance of a machine learning model using several evaluation techniques. I completed the confusion matrix to compare the model's predictions against the actual results. I also calculated precision, recall, and F1-score to better understand the model's performance beyond accuracy. I used 5-fold cross-validation to evaluate how consistently the model performed across different subsets of the dataset. During the lab, I encountered some coding errors and learned the importance of running previous cells in Google Colab to ensure all variables were defined before executing additional code.

What I Learned This lab helped me better understand how to evaluate a machine learning model. I learned that accuracy alone does not always provide a complete picture of performance and that precision and recall are important depending on the consequences of incorrect predictions. I also gained more experience troubleshooting Python code and using scikit-learn to evaluate model performance.

L07 Contribution Journal: Model Evaluation

For Module 7 lab, I first fixed the notebook lab because it had no line breaks in each cell, so I fixed the formatting before I began the work. I ran the setup cell that loads the Titanic dataset and trains the logistic regression model. Then I completed Task 1 by building a confusion matrix heatmap that showed 90 true negatives, 15 false positives, 20 false negatives, and 54 true positives. I finished Task 2 with a classification report that gave me 0.80 accuracy. I completed Task 3 with 5-fold cross-validation that gave an average score of 78.68%. After completing the tasks, I answered the three knowledge check questions and researched real cases, like the wrongful arrest in Detroit, to support my answers. Lastly, I wrote my reflection journal, connecting concepts to my final project for my Computer Vision course, then wrote this contribution journal. I sent both journals and my notebook to group member Aaliyah Phillips for submission.

Elquin Ponce

My contribution was preparing the data, running the models, evaluating their results, and completing the knowledge check. In the lab I trained a logistic regression model on the Titanic dataset to predict whether a passenger survived, using age, passenger class, sex, and fare as features. Instead of stopping at accuracy, I used three more detailed ways to evaluate the model: a confusion matrix, a classification report with precision, recall, and F1-score, and 5-fold cross-validation.

Module 07 Lab Contribution Journal

For this lab I contributed to the group by independently working through the Notebook, taking notes to ensure understanding, then having meaningful discussions with my group members about what we all learned. I also took the time to answer the knowledge check questions to the best of my ability, which I included in my reflection journal for submission.
